Its development team made AutoCAD capable of producing the "look" of a drafting program before it was capable of producing the necessary calculations. Unlike many CAD software applications, AutoCAD is a multi-user application, meaning that more than one user can work on a single drawing. While AutoCAD is highly regarded for its design capabilities, the software's role in

the CAD market has evolved over time. AutoCAD's design features include 2D drafting, 2D and 3D modeling, 2D and 3D drawing, 3D rendering, and data management. In 2D and 3D drafting, users can draw objects and design layouts and structures. In 2D modeling, the user can model objects in two dimensions and create drawings of 2D drawings. In 3D modeling, the user can model objects in three dimensions. In 2D drawing, the user can draw both 2D and 3D objects, and add line, text, and shape features. In 3D drawing, the user can draw all types of 3D objects and add line, text, and shape features. In 3D rendering, the user can view and render 3D images. In data management, the user can store, work with, and share CAD data. After AutoCAD was introduced, users could also import 2D drawings into AutoCAD and convert AutoCAD drawings into other file formats, such as PDF, PostScript, and the Bézier format. Importing 2D drawings from other applications and converting 2D drawings into other file formats is not available in current versions of AutoCAD. The only application capable of converting 2D drawings into other file formats is the PDF format. 2D drawings that can be viewed only in AutoCAD are not able to be viewed in any other application. AutoCAD's design also includes a variety of tools for creating and editing styles. A style is a template used to create a drawing. Multiple styles can be used to create a drawing with multiple colors and textures. AutoCAD is used in the design of a wide range of products, including automobiles, planes, boats, railroad cars, buildings, bridges, and infrastructure. AutoCAD History

AutoCAD's roots are in New York City, New York. The roots of Autodesk, the company that makes AutoCAD, are in the same city. Jerry Evans was a developer at Evans & Sutherland (now CAE

AutoCAD also supports FEM (Finite Element Analysis), a discrete element method for solving complex mechanical engineering problems based on the differential equations that describe the behavior of an object when it is subjected to forces. Software architecture The AECS language, employed by Autodesk Design Review, is a graphical programming language used in Autodesk software. History In early versions of AutoCAD, the user could draw a spline, and connect several parts of the spline together to make a shape. With the addition of AutoCAD's ability to draw splines, the tools needed to program AutoCAD were also able to do this as well, and so Autodesk AECS became the programming language for AutoCAD. Originally, it was only used to draw splines and develop AutoCAD's development tools. Later, it was also used to develop the "simplified line drawing" command, and later still, the ability to draw meshes in AutoCAD was added. Later still, the programming language was used to develop the drawing tools themselves.

AECS is a general-purpose programming language that uses icons to represent objects and procedures, and has variables, loops, and subroutines. For example, an operation may be represented by an icon called "JUMP" which has a circle for the user to input a value. It can be used to program any type of computer application including drawing tools, AutoCAD extensions, and user-created AutoCAD applications. See also Comparison of CAD editors for vector graphics

SAN JOSE — A self-driving Uber crashed into a bus that was turning left and was not moving at the time, according to California Highway Patrol, who said there were no passengers on board the bus. The crash happened at 7:49 p.m. in a southbound lane of southbound Highway 101 near Mare Island Road in San Jose. The bus stopped immediately after the crash and no one was injured. The self-driving Volvo SUV was on its side on the right shoulder of the highway. The SUV was partially blocking the right shoulder but most of the vehicle was off the side of the highway. The CHP said it received reports of the crash but did not initially respond because the self-driving Volvo SUV was blocking the southbound lanes. Around 7:50 p.m., the CHP said the car's emergency lights were on and a tow truck responded to the scene. Caltrans shut down the right shoulder of southbound Highway 101, forcing all traffic to the left shoulder. Traffic was backed up for miles, according to CHP. No charges will be filed in the crash, CHP said. The National Transportation Safety Board also will investigate the crash, as part of its ongoing probe into the March 18 deadly crash of a self-driving Uber in Arizona. The NTSB's investigation typically takes several months to complete. The board's investigation of that crash — in Arizona — is ongoing, and the agency is not releasing preliminary findings in the case. In that crash, the SUV was on the right shoulder of eastbound Interstate 10 when it was struck broadside by a tractor-trailer truck. Uber confirmed the crash killed its Arizona engineer who was testing the self-driving car.
