AutoCAD Basics The easiest way to use AutoCAD is to create a new drawing and then add elements. In the drawing window, select Object | New | 2D AutoCAD Drawing, and enter a name and location for your drawing. Once a new drawing is created, you can start adding objects to it. To add an object, go to the drawing window's toolbar, select Object | Annotate and Draw, and then select the desired type of object you want to create. Type a number in the Object Number box to select the desired object, and then click OK. The object is placed in the drawing window. To change the properties of an object, you select it in the drawing window and then right-click. A window will open with options to change the properties. To continue creating objects, use the Step button. You can select multiple objects in the drawing window by holding down the Shift key as you select them, and then use the tool box on the right side of the drawing window to select them all at once. Create complex drawings by combining simple objects. To create a compound object, first create the individual objects that will make up the compound object. Then go to the drawing window and select Object | Combine and then choose the objects you want to combine. You can drag and drop the objects or use the arrow buttons to select the objects. A new compound object is created in the drawing window. To view a compound object, double-click it or select Object | View. You can make a compound object more easily by using the object snap. Select Object | Snap | Object Snap, and then click the button to toggle snapping mode on and off.
